

Follow Link to a Problem

Gideon Buckwalter

BASIC COURSE:

When the User submits a GET request to a url which corresponds to a valid Problem, the server searches the Central Database for the corresponding Problem. Then the server sends the Problem's start and goal Expression Trees to the client. The User's browser is redirected to the Expression Manipulator page. The Expression Manipulator renders the start Expression Tree, and begins accepting user input.

ALTERNATIVE COURSES:

The requested problem does not exist: The User is redirected to an error page, and the system displays a message giving reasons why the Problem may have been deleted.
